## Tutorial 1 | CN-CS331 | 03 Feb 2025

Problem 1:

$$\text{Link Rate} = R \text{ bps} \quad | \quad \text{Propagation Speed} = s \text{ m/s}$$

$$\text{distance} = m \text{ meters} \quad | \quad \text{Packet size} = L \text{ bits}$$

a) End-to-end delay = Transmission delay + Propagation delay

Ignore ~~→~~ ~~Processing~~ (Processing delay, queuing delay)

$$d_{\text{trans}} = \frac{L}{R} \quad | \quad d_{\text{prop}} = \frac{m}{s}$$

$$= \frac{L}{R} + \frac{m}{s}$$

b). The last bit has just been fully transmitted but has not yet reached host B. It is just starting to propagate through the link. The last bit is just leaving host A and is at the very beginning of the link.

c). At  $t = d_{\text{trans}}$ , the first bit has already been propagating for  $d_{\text{trans}}$  seconds. Since propagation speed is  $s$ , the first bit will have traveled:

$$\text{distance} = s \times d_{\text{trans}} = s \times \frac{L}{R}$$

host B.

The 1<sup>st</sup> bit is at a distance  $s \cdot \frac{L}{R}$  from host A, but it has not reached

d). Since  $d_{prop} < d_{trans}$ , the 1<sup>st</sup> bit would have reached Host B before  $d_{trans}$  is completed. The 1<sup>st</sup> bit has already arrived at host B before  $t = d_{trans}$ .

For store & forward = 1<sup>st</sup> bit is at host B and has been waiting there for  $[d_{trans} - (d_{prop} \text{ time} + \text{time to transmit one bit})]$  seconds.

~~For each message~~

$$l), m = ? \text{ such that } d_{prop} = d_{trans} \rightarrow \frac{m}{s} = \frac{L}{R}$$

$$m = \frac{L}{R} \times s \text{ where } s = 2.5 \times 10^8 \text{ m/s, } L = 120 \text{ bits}$$

$$R = 56 \text{ kbps} = 56 \times 10^3 \text{ bps}$$

$$m = \frac{120}{56 \times 10^3} \times 2.5 \times 10^8 = \frac{120}{56} \frac{300 \times 10^8}{10^3} = \frac{300 \times 10^5}{56}$$

$$m \approx 5.36 \times 10^5 = 536 \text{ km.}$$

Problem 2.

Total delay 1. Transmission delay for each link ( $d_{trans,i}$ )

$$d_{trans,i} = \frac{L}{R_i}$$

24	25	26	27	28	29	30

Problem 3 - Since the 1<sup>st</sup> ~~bit~~ bit does not wait for full packet transmission at each switch, the total delay consists of:

1 Transmission delay of only the 1<sup>st</sup> link:

$$d_{\text{trans}} = \frac{L}{R}$$

(Only the 1<sup>st</sup> link's transmission delay matters.)

2. Propagation delay for all 3 links:

$$d_{\text{prop, total}} = \sum_{i=1}^3 \frac{d_i}{R_i}$$

Total end-to-end delay is:

$$d_{\text{end-to-end}} = d_{\text{transf}, 1} + d_{\text{prop}, i}$$

$$= \frac{L}{R} + \frac{d_1}{R_1} + \frac{d_2}{R_2} + \frac{d_3}{R_3}$$

$$L = 1500 \text{ Bytes} = 1500 \times 8 = 12,000 \text{ bits} \quad | \quad R = 2 \text{ Mbytes} = 2 \times 10^6 \text{ bytes}$$

16 SUNDAY

$$\lambda = 2.5 \times 10^8 \text{ m/s} \quad | \quad d_1 = 6 \times 10^6 \text{ m}$$

$$d_2 = 3 \times 10^6 \text{ m}$$

$$d_3 = 1 \times 10^6 \text{ m}$$

$$d_{\text{transf}, 1} = 0.006 \text{ sec} = 6 \text{ ms} \quad | \quad d_{\text{prop}, 1} = \frac{6 \times 10^6}{2.5 \times 10^8} = 24 \text{ ms}$$

17

2018 WK 51 • 351-014

8  $d_{prop,2} = \frac{d_2}{R} = \frac{3 \times 10^6}{2.5 \times 10^8} = 12 \text{ ms}$

9 10  $d_{prop,3} = \frac{d_3}{R} = 4 \text{ ms}$

11 Total =  $6 + 2 \times 4 + 12 + 4 = 40 \text{ ms}$ .

12 Problem 9 - We assume :-

Packet length = L bits | No propagation delay.

1 Number of links = N

Transmission rate of each link = R bps | Store & forward switching.

Step 1.

① Transmission delay per link

The transmission delay ( $d_{transf}$ ) is the time required to push the entire packet onto a link =  $\frac{L}{R}$

Since the packet must be fully received before transmission

on the next link, each link contributes a delay of  $d_{transf}$ .

Step 2. The 1<sup>st</sup> link starts transmitting immediately. The second link can only start transmission after the 1<sup>st</sup> link has finished & so on.

Since there are N links, and each introduces a transmission delay,

$$d_{end-to-end} = N \times \frac{L}{R}$$

18

TUE  
DEC

WK 51 • 352-013

2018

7

DECEMBER 2018						
M	T	W	T	F	S	S
31					1	2
3	4	5	6	7	8	9
10	11	12	13	14	15	16
17	18	19	20	21	22	23
24	25	26	27	28	29	30

When sending multiple packets back-to-back, the 2<sup>nd</sup> packet <sup>8</sup> experiences the full delay computed above. However, the second packet can start transmission on the 1<sup>st</sup> link immediately after the 2<sup>nd</sup> packet ~~finishes~~ finishes transmission there.

<sup>10</sup> Thus, for  $P$  packets

<sup>11</sup> The 1<sup>st</sup> packet takes  $N \times \frac{L}{R}$  seconds.

<sup>12</sup> Each subsequent packet leaves the 1<sup>st</sup> link every  $\frac{L}{R}$  seconds, forming a pipeline effect.

$$\text{d}_{\text{total}} = (N + (P - 1)) \times \frac{L}{R}$$

Problem 5.

Little's formula:  $N = \lambda \cdot d$ .

<sup>4</sup>  $N = \text{Avg no. of packets in the system}$ .

<sup>5</sup>  $\lambda = \text{packet arrival rate}$  |  $d = \text{avg total delay per packet}$  (queuing delay + transmission delay).

$$N = 10 \quad | \quad d_{\text{queue}} = 10 \text{ ms} = 0.01 \text{ sec} \quad | \quad \text{Tr. rate} = 100 \text{ packets/sec}$$

$$d = d_{\text{queue}} + d_{\text{trans}} \quad | \quad d_{\text{trans}} = \frac{1}{\text{Tr. Rate}} = \frac{1}{100} = 0.01 \text{ sec.}$$

$$d = 0.01 + 0.01 = 0.02 \text{ sec.}$$

(8)

**CARNET**

Date: / /

Page No.:

$$N = a \cdot d \quad | \quad 10 = a \times 0.02 \quad | \quad a = \frac{10}{0.02} = 500 \text{ packets/sec}$$

Problem 6 Shared middle hop with total capacity

$$R = 100 \text{ Mbps}$$

Serves-to shared link capacity =  $80 \text{ Mbps} = R_s$

Serves-to client link capacity =  $R_c = 50 \text{ Mbps}$

Path

Server  $\rightarrow R_s \rightarrow R \rightarrow R_c \rightarrow$  Client

a) Max achievable end-to-end throughput per Pass. =

$$\frac{R}{4} = \frac{100}{4} = 25 \text{ Mbps} \rightarrow$$

b) A bottleneck link is the slowest link along the path that limits throughput.

$$R_s = 80 \text{ Mbps}$$

$$R = 100 \text{ Mbps}$$

$$R_c = 50 \text{ Mbps}$$

The bottleneck is R.

$$(c) \quad \text{Utilization} = \frac{\text{Actual Data Rate}}{\text{Link Capacity}} = \frac{25}{80} = \frac{5}{16} = 0.3125$$

$$(d) \quad \text{Utilization} = \frac{25}{50} = 0.5$$

- (Q) The shared link carries four flows, each at 25 Mbps, for a total of:

Date: \_\_\_\_\_

$$4 \times 25 = 100 \text{ Mbps}$$

Since the link capacity is also 100 Mbps,

$$\therefore \text{Utilization} = \frac{100}{100} = 1$$

of R

Problem - 7

- (A). Given N packets arrive at the same time.

Length of each packet = L bits

Link transmission rate = R bps

Transmission delay per packet

$$d_{\text{trans}} = \frac{L}{R} \text{ sec}$$

1<sup>st</sup> packet experiences 0 queuing delay.

2<sup>nd</sup> packet waits for 1 transmission time before starting transmission.

3<sup>rd</sup> packet waits for 2 transmission times before starting & so on.

k<sup>th</sup> packet waits for (k-1).d<sub>trans</sub>.

$$\text{Total queuing delay} = 0 + d_{\text{trans}} + 2d_{\text{trans}} + \dots + (N-1)d_{\text{trans}}$$

$$\sum = d_{\text{trans}} \times [1 + 2 + \dots + N-1]$$

$$= d_{\text{trans}} \times \frac{N(N-1)}{2}$$

For avg, divide by  $N$ .

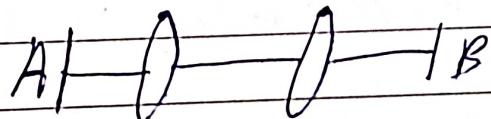

$$= \frac{1}{R} L \times \frac{N(N-1)}{2N} = \frac{(N-1)L}{2R}$$

(B)  $N$  such packets arrive at the Link every  $\frac{LN}{R}$  seconds.

Avg queuing delay will be same

$$= \frac{(N-1)L}{2R}$$

Problem 8:

File size =  $F$  bits

Segment size =  $S$  bits

Header size = 80 bits

Packet size =  $(S + 80)$  bits

$$\text{Number of segments (packets)} = N = \frac{F}{S}$$

Using formulae derived in Problem 7.

$$d_{\text{total}} = [N + (P-1)] \times \frac{L}{R} = \frac{(F + 3-1)(80+S)}{R}$$

$$= \frac{160}{R} + \frac{2S}{R} + \frac{80F}{SR} + \frac{F}{R}$$

Date: \_\_\_\_\_

Taking derivative of  $d_{\text{total}}$  w.r.t.  $s$ .

$$\frac{d(d_{\text{total}})}{ds} = 0 + \frac{2}{R} - \frac{80F}{s^2 R} + 0 = 0$$

$$\frac{2}{R} = \frac{80F}{s^2 R} \Rightarrow s = \sqrt{40F}$$

Problem 9.

My computer  $\rightarrow$  Resolves.

- 2). Resolves  $\rightarrow$  Root DNS  $\rightarrow$  Response (TLD serves for .in)
2. "  $\rightarrow$  TLD DNS(.in)  $\rightarrow$  " (Authoritative servers for .ac.in)
- 3). "  $\rightarrow$  Authoritative DNS(.ac.in)  $\rightarrow$  Response (Authoritative server for www.iiitgn.ac.in)
- 4). Resolves  $\rightarrow$  Authoritative DNS(iiitgn.ac.in)  $\rightarrow$  Response (IP address of www.iiitgn.ac.in)

Total number of query-response pairs is 4.

Problem 10. Number of SMTP servers (hops) = 3

Processing delay per SMTP server = 30 ms.

Number of links = 4.

Propagation delay per link = 20 ms.

Total processing delay =  $3 \times 30 \text{ ms} = 90 \text{ ms}$

" Propagation delay =  $4 \times 20 \text{ ms} = 80 \text{ ms}$

Total Delay =  $80 + 90 = 170 \text{ ms}$ .

Date: \_\_\_\_\_

Problem 11 Given Data

$1 \text{ HTML file} = 5 \text{ KB}$	$5 \text{ images} = 50 \text{ KB each}$
$3 \text{ CSS } \rightarrow = 2 \text{ KB each}$	$\text{Total objects} = 1 + 3 + 5 = 9$
$\text{RTT time} = 50 \text{ ms} (0.05 \text{ sec})$	$\text{Bandwidth} = 10 \text{ Mbps} = 10 \times 10^6 \text{ bps}$

$$\text{Download time} = \frac{\text{File size (in bits)}}{\text{Bandwidth (in bps)}}$$

a). Each object requires:

- (1) 1 RTT for TCP connection establishment.
- (2) 1 RTT for HTTP request & 1<sup>st</sup> byte response.
- (3) Download time.

Download time for each object.

$$\begin{aligned} \text{HTML} &= 5 \text{ KB} = 50,000 \text{ bits} \rightarrow 4 \text{ ms} \\ \text{CSS (each)} &= 2 \text{ KB} = 16,000 \text{ bits} \rightarrow 1.6 \text{ ms} \\ \text{Image (each)} &= 50 \text{ KB} = 500,000 \text{ bits} \rightarrow 90 \text{ ms.} \end{aligned}$$

Each object has a delay of 2 RTT + download time.

$$\text{HTML} 2 \times 0.05 + 0.004 = 0.104 \text{ s}$$

$$3 \text{ CSS Files} 3 \times (2 \times 0.05 + 0.004) = 0.3048 \text{ s}$$

$$\text{Images} 5 \times (2 \times 0.05 + 0.04) = 5 \times 0.14 = 0.7 \text{ s}$$

$$\text{Total} = 0.104 + 0.3048 + 0.7 = 1.1088 \text{ sec}$$

Date: \_\_\_\_\_

b). HTTP/2 with multiplexing

Single TCP connection is used.

$$\text{Total data to download} = 5 + (3 \times 7) + (5 \times 50)$$

$$= 261 \text{ KB}$$

$$\text{Total download time} = \frac{261 \times 8,000}{10,000,000} = 0.2088 \text{ sec.}$$

Adding 2 RTT (Connection) + 2 RTT (Request Response):

$$0.05 + 0.05 + 0.2088 = 0.3088 \text{ sec.}$$

Problem 12.

Cache Hit Rate = 80% Cache Lookup time = 1 ms.

Cache Miss Rate = 20%.

External resolution follows these steps:

1. Query to the root server  $\rightarrow$  RTT = 50 ms.

2. TLD server  $\rightarrow$  RTT = 70 ms

3. Authoritative server  $\rightarrow$  RTT = 100 ms.

4. Total external resolution time =  $50 + 70 + 100 = 220 \text{ ms}$ .

Invalid queries = 10%.

They don't go through the external resolution process.

Valid queries = 90%.

Either caching or external resolution.

14

Date: \_\_\_\_\_

$$T_{avg} = (\text{Cache Hit Rate} \times T_{cache}) + (\text{Valid Cache Miss Rate} \times T_{external}) \\ + (\text{Invalid miss rate} \times T_{invalid})$$

$$T_{avg} = 0.80 \times 2 + 0.10 \times 220 + 0.1 \times 10 \\ = 0.8 + 34.6 + 1 = 36.4 \text{ ms.}$$

2 Hit Rate = 95 %.

$$T_{avg, new} = 0.95 \times 1 + 0.05 \times 220 + 0.1 \times 10 \\ = 0.95 + 11 + 1 = 12.95 \text{ ms.}$$

$$\text{Improvement in \%} = \frac{(36.4 - 12.95) \times 100}{36.4} \\ = \underline{\underline{28.45}} \times 100 = 68.73 \% \text{ faster.}$$

Problem 13.

1 Time for base web page (single object).

2 DNS resolution.

Client requires local DNS resolves ( $RTT_0 = 1 \text{ ms}$ ).

If IP is not cached, the local DNS contacts the external DNS server ( $RTT_1 = 47 \text{ ms}$ )

$$\text{Total DNS Time} = RTT_0 + RTT_1 = 1 + 47 = 48 \text{ ms.}$$

Date: \_\_\_\_\_

$RTT_{HTTP} = 72 \text{ ms}$   $\xrightarrow{\text{For}}$  TCP 3-way handshake.

$RTT_{HTTP} = 72 \text{ ms}$  For client sends an HTTP request.

$RTT_{HTTP} = 72 \text{ ms}$  Server responds

$$\text{Total Time} = 48 + 72 + 72 = 192 \text{ ms}$$

II

1. Step from part I : 192 ms for DNS + base object
2. Each add. object requires a new TCP connection, each taking 2 RTT's.

$$7 \text{ objects} \times [2 \times RTT_{HTTP}] = 7 \times 48 = 1008 \text{ ms}$$

$$3. \text{ Total time} : 192 + 1008 = 1200 \text{ ms.}$$

III

1. DNS + Base Page = 192 ms
2. Batch 1 (5 Objects) = 144 ms.
3. Batch 2 (2 " ) = 147 ms.

$$\text{Total} = 480 \text{ ms}$$

IV

1. DNS + Base Page = 192 ms.
2. Batch 1 (5 objects, 2 RTT) : 72 ms.
3. 1 2 (2 " , 2 RTT) : 72 ms.

$$192 + 72 + 72 = 336 \text{ ms.}$$

Fastest method is Persistent HTTP with Parallel connections (336 ms)

## ~~Fastest~~ Problems - 14

Q). Now cache is installed on LAN.

$$hit\ rate = 60\%$$

60% do an RTT from host to local cache over a 100 Mbps link:

$$\alpha = 0.6 \times \left( \frac{1}{100 \times 10^6 \text{ bps}} \times 8,50,000 \text{ b} \times 2 \right)$$

$$\alpha = 0.017 \text{ sec}$$

70% of the bits query to cache, fail & finally again travel on the access link (15 Mbps)

Avg. response time for this.

$$= \underbrace{\Delta}_{1 - \Delta \beta_{\text{new}} \text{ for RTT}} + \underbrace{3 \text{ sec}}$$

$$\beta_{\text{new}} = 0.4 \times \beta = 0.4 \times 16 \text{ requests/sec} = 6.4 \text{ req./s.}$$

$$\text{Avg. response time for miss} = \underbrace{\Delta}_{1 - \Delta \times 6.4} + 3$$

$$= 3.089 \text{ s}$$

Total time =

$$0.6 \times (\alpha) + 0.4 \times (\alpha) + 3.089 \text{ s} = 0.6 \times \alpha + 0.4 \times 3.089$$

$$= 0.017 + 1.2356 \text{ s}$$

$$= 1.2526 \text{ s} = \text{Total response time.}$$

Problem 15. Total time accounts for all below pts.

$$2. \text{ DNS lookup time} = \sum_{i=1}^n RTT_i = RTT_1 + RTT_2 + \dots + RTT_n$$

$$2. \text{ TCP connection establishment} = 2RTT$$

$$3. \text{ HTTP Request & Response} = 2RTT$$

$$T_{\text{total}} = \sum_{i=1}^n RTT_i + 1RTT + 1RTT$$

$$= \sum_{i=1}^n RTT_i + 2RTT$$
